

Lab Equipment and Other Third-Party System Interfacing

The interoperability of medical/lab equipment devices with the Hospital Information System is critical in enhancing the productivity and efficiency of the healthcare ecosystem. The equipment interfacing primarily removes the manual entering of data – from the diagnostic device to HIS/LIS – saving time and effort of the laboratory staff. Moreover, the process of data capture and transfer by connecting machines will ensure a better quality of data and integrity. It removes transcription errors from the clinical system.

Over the last 25 years, Datamate has interfaced a wide range of laboratory devices, primarily from 200+ popular medical equipment brands. Besides lab equipment interfacing, Datamate also makes it feasible to interface hospitals' HIS with other systems like third-party software, mobile applications, devices like biometric, IPTV, barcode sticker printing, card printing, wristband printing, direct printing on tubes, device labels, quick vitals, call center solutions, speech recognition software/solution, and so on.
